2 Basic O-Ring Elastomers

Polyacrylate (ACM) Rubber

Polyacrylate Rubber was developed for applications in automotive engine and transmission to have better resistance to oil. The backbone contains acrylic esters (typically ethyl and methyl acrylate) and reactive cure site monomer (carboxylic acid or chloroethyl vinyl ether). ACM rubber has good resistance to mineral oil and high additive oils, such as transmission lubricants, automatic transmission fluid (ATF), and steering fluid. A typical sealing application includes some rotary shaft lip seals for gearboxes but the majority of applications are static seal and non-seal applications.

Water compatibility and cold flexibility are the limitations of ACM rubber. However, with special formulation, ACM's low temperature tolerance range can be extended to as low as -40°C (-40°F), based on TR10 value.

Curing system of ACM uses methylene dianiline, hexamethylene diamine carbamate, or metalcarboxyl soaps, such as sodium- or potassium stearate. In addition, sulfur acts as a catalyst.

| General Information | | Temperature Range | |
|-----------------------------|-----------------|----------------------|------------------------------------|
| ASTM D1418 Designation | ACM | Standard Temperature | 5°F to 302°F (-15°C to 150°C) |

- Aromatics and chlorinated hydrocarbons
- Hot water, steam
- Acids, alkalis, amines

Ethylene Acrylic Elastomer (AEM)

Ethylene Acrylic is also known as AEM or Vamac®. This material was designed to be used in automotive applications and enhance the low-temperature flexibility over acrylic elastomer (ACM). AEM is made into components due to its excellent physical properties, including low compression set and good resistance to automotive fluids, such as transmission fluid and engine oil.

Common applications of AEM include engine seals, gasket, specialty hoses, and boots. It is typically selected to replace Nitrile Rubber or neoprene for better performance, and the cost is lower than HNBR and FKM.

Typical curing systems on AEM are Diamine-based and peroxide-based.

Vamac® is a registered trademark of Celanese.

Butyl Rubber (IIR)

One of Butyl's outstanding features is its low permeability to gases, and therefore is widely used in applications where this is an advantage, such as inner tubes and tire inner liners. And because IIR is largely saturated, it has excellent aging stability.

Brominated (BIIR) and chlorinated (CIIR) modifications of IIR are also used in the industry.

Chloroprene Rubber (CR)

Chloroprene is one of the first successful synthetic elastomer materials developed by DuPont in 1931 and was given the tradename of Neoprene. The material features superior weatherability, good resistance to sun, heat, and ozone, and it performs well in contact with oils and many chemicals. In addition, standard CRs are metal oxide cured with organic accelerators, and have lower permeability to air and water vapor.

Chloroprene is also used in an impressively wide variety of environments, including automotive, civil engineering, and wire and cable industries. For example, CR is often used in air conditioning systems, especially old refrigerated media like R12 or R22 and lubricant with mineral oil.

| General Information | | Temperature Range | |

Ethylene Propylene Rubber (EPR, EPDM)

Ethylene Propylene Rubber (EPDM) usually possesses remarkable resistance to ozone, weathering and heat, and has great flexibility at low temperature, good chemical resistance, and good electrical insulation properties. There are a small number of double bonds external to its backbone. A few examples of EPDM applications are roofing, seals, hoses, and gaskets.

Common Variations in EPDM

- Sulfur-Cured: Standard EPDMs are usually sulfur-cured, offering better flex properties but are more prone to hardening and poor compression set with high temperature
- Peroxide-Cured: Allows EPDM to achieve better heat resistance and lower compression set. However, compared with sulfur-cured, it is also more expensive and difficult to produce
- Formulated with “white list” ingredients specified in 21.CFR 177.2600: For use in applications where the elastomer will be in contact with food or beverages
- Lubricated: To enhance ease of installation or reduce friction for dynamic applications

Common Applications

- If approved by the National Sanitation Foundation (NSF), EPDMs can be used in drinking water applications
- Automotive air conditioning systems utilize R134a refrigerant gas with POE or PAG lubricant, alongside the environmentally friendly refrigerant R744. In R744 air conditioning systems, exceptional resistance to explosive decompression in hydrogen dioxide under high pressure and high temperature conditions is essential
- Phosphate ester type hydraulic fluids

Perfluoroelastomers (FFKM)

Perfluoroelastomers (FFKM) are composed of fully fluorinated polymer chains, providing exceptional performance in terms of heat and chemical resistance. These materials demonstrate outstanding resistance to fuels, all types of lubricating oils and greases, mineral-based hydraulic fluids, solvents, alcohols, and most acids and alkalis.

Common Variations

- Standard FFKM: Typically peroxide-cured, these compounds are highly reliable. However, FFKM compounds that are triazine-cured offer superior heat resistance compared to their peroxide-cured counterparts.
- Performance: FFKM exhibits remarkable resistance to extreme temperatures, oils, solvents, flames, chemicals, and environmental factors. As a result, it is widely utilized in demanding industries such as semiconductor manufacturing, chemical processing, aerospace, and other industrial applications.
- Oil and Gas Applications: FFKM is also highly effective in the oil and gas sector, performing well in environments with highly aggressive media, high pressure, and extreme temperatures. Moreover, it is resistant to rapid gas decompression, ensuring durability in challenging conditions.

Fluorocarbon Elastomer (FKM, FPM, Viton™, FEPМ)

Fluorocarbon is a well-known, high-performance rubber, which was first commercialized by DuPont in 1958. FKM has excellent resistance to high temperature, weather, ozone, mineral oil, fuels, hydraulic fluids and many organic solvents and chemicals.

There are many grades of FKM, with each grade containing various amount of fluorine content. Fluorocarbon rubbers that contain vinylidene fluoride (VF2) and hexafluoropropylene (HFP) monomers are most commonly used in the industry.

DSC specializes in FKM technology and concentrates on all grades of FKM, as they are core competences. From the most popular A-type, medium fluorine content (B-, GBL-type), high fluorine content (F-, GF-type), to low temperature type (GLT, GFLT) and Viton™ ETP Extreme.

We also supply AFLAS® and FEPМ, which features an excellent acid and alkali resistance.

Standard FKM is commonly vulcanized by bisphenols. By using a peroxide cure system compound, the material's resistance to acid, a few organic amides, and amine can be enhanced.

Viton™ is a register trademark of The Chemours Company. AFLAS® is a register trademark of AGC Inc.

Fluorosilicone Rubber (FVMQ)

Similar to silicone rubber, FVMQ bonds trifluoropropyl, vinyl, and methyl as side chains, while the physical and mechanical properties are like VMQ. FVMQ offers better fuel and mineral oil resistance but poorer hot air resistance than standard VMQ. Therefore, the primary use of FVMQ are static sealing applications. Static seals are often found in hydraulic and fuel systems.

Common Variations

- Peroxide-cured
- In contact with jet and automotive fuels, engine oil, and most solvents, because FVMQ has great low-temperature flexibility, especially in the aerospace industry
- FVMQ compounds meet MIL-R-25988 specification

Hydrogenated Nitrile Rubber (HNBR)

Hydrogenated Nitrile was developed to enhance conventional nitrile rubber by saturating the double bonds in the butadiene segment with hydrogen. This improves the polymers' temperature and chemical resistance and mechanical properties. HNBR is well-known for its high strength and high elongation, making it popular in the oil and gas industry, chemical industry, diesel engines and similar harsh environments. HNBR is also commonly used in automotive air conditioning systems due to its exceptional resistance to R134a or newer refrigerants, such as R401a, R404a, R410a, R507, R744, and R1234yf.

DSC supplies Peroxide-cured HNBR as our standard compound. HNBR can also be Sulfur-cured to improve its flexibility in dynamic systems.

- Chlorinated hydrocarbons
- Strong acid
- Polar solvents(Ketones, ethers, esters)

Acrylonitrile-Butadiene (NBR)

Acrylonitrile butadiene copolymer is also known as Nitrile Rubber, NBR or Buna® N. Nitrile rubber is one of the most common materials for sealing components, due to its resistance to petroleum base fuels and lubricants. A wide variety of nitrile rubbers are used in producing rubber compounds.

The Acrylonitrile (ACN) content of nitrile rubber varies from 18% to 50%. The ACN content influences physical properties and chemical compatibility. Lower ACN content provides better low-temperature physical properties but compromises on fuel and lubricant resistance. Higher ACN content enhances the fuel and polar lubricant resistance but also reduces low temperature properties. The standard ACN content in Nitrile rubber is 34%.

Nitrile rubber can be vulcanized by sulfur or peroxide curing systems. Sulfur-based vulcanization offers better low-temperature properties but reduces heat aging resistance. Peroxide-curing enhances thermal resistance and results in lower compression sets, but it costs more to manufacture.

| General Information | | Temperature Range | |
|-----------------------------|-----------------|------------------------------|----------------------------------|
| ASTM D1418 Designation | NBR | Standard Temperature | -50°F – 212°F (-40°C – 100°C) |

Polyurethane (PU, AU, EU)

There are two types of Polyurethane, one based on polyester (AU) and the other on polyether (EU), both in millable and thermoplastic (TPU) forms. Polyurethane has wear resistance and tensile strength that are typically two or three times higher than comparable elastomers, such as nitrile. PU is also a common material for hydraulic and pneumatic reciprocating seals. The elastomer surface texture is very different from other elastomers.

Common Variations

- In hydraulic systems, TPU outperforms millable polyurethane.
- In working environments where moisture condensation occurs on the surface of rubber seals, EU-based compounds are a better choice than AU-based compounds due to their resistance to hydrolysis.
- Higher aniline point oil should be used with EU compounds.

| General Information | | Temperature Range | |
|-----------------------------|---------------------|------------------------------|----------------------------------|
| ASTM D1418 Designation | EU, AU | Standard Temperature | -40°F – 176°F (-40°C – 80°C) |

Silicone Rubber (VMQ)

Silicone rubbers are inorganic polymers with a silicone backbone attached to a pendant group consisting of methyl, phenyl, and vinyl. The side chain significantly affects the polymer's chemical and physical properties. VMQ has exceptional thermal and ozone resistance, dielectric stability, and resistance to many chemicals, oils, and solvents. Silicone rubber has the best low-temperature flexibility among the rubber family. Silicone has limited tensile and tear strength, therefore engineers need to be extra cautious while designing silicone components.

DSC supplies peroxide-cured standard silicone but also provides platinum-cured materials for medical and other low-volatile applications.

| General Information | | Temperature Range | |
|-----------------------------|------------------|------------------------------|---------------------------------------|
| ASTM D1418 Designation | Q, MQ, VMQ, PVMQ | Standard Temperature | -76 °F – 437°F (-60 °C – 225 °C) |

- Concentrated acids and alkalis
- Steam over 120°C
- Petroleum oil and fuel
- Ketones

Carboxylated Nitrile (XNBR)

Carboxylated Nitrile (XNBR) has better tear and abrasion resistance than traditional NBR because the polymer backbone has been chemically modified with a carboxylic acid containing group. These features make XNBR a great choice for dynamic assembly, such as rod wipers and seals, and high pressure reciprocating seals. However, some low temperature properties, compression set, and water resistance are sacrificed after the modification.

4 O-Ring

O-Ring Design Guideline

Extrusion Limit of O-Ring & Clearance Gap

The O-Ring is secured within the gland and is compressed to fill surface imperfections and any available clearance gaps. It functions effectively under low-pressure conditions by maintaining a seal through compression. However, as pressure increases, the O-Ring undergoes distortion, which enhances strain and creates a tighter seal. Under high-pressure conditions, the O-Ring may extrude into the clearance gap, potentially causing seal failure in standard gland configurations.

To prevent extrusion, an anti-extrusion back-up ring made from durable, cut-resistant materials such as PTFE or hard rubber can be utilized. In static applications, gland design modifications may allow higher pressure resistance without requiring a back-up ring. Regardless of the approach, careful attention is necessary to minimize extrusion. The extent of extrusion is influenced by factors such as O-Ring hardness, pressure, and clearance gap. Refer to FIG 1, FIG 2, and Table 1 for additional details.

FIG. 1

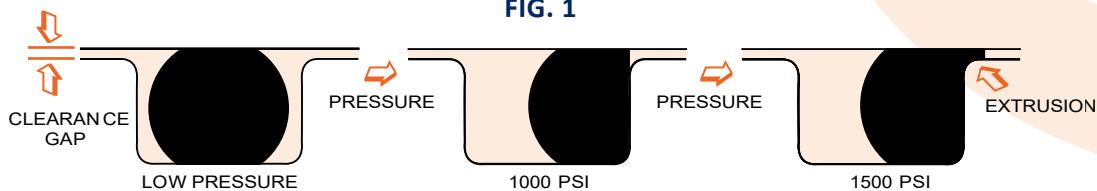

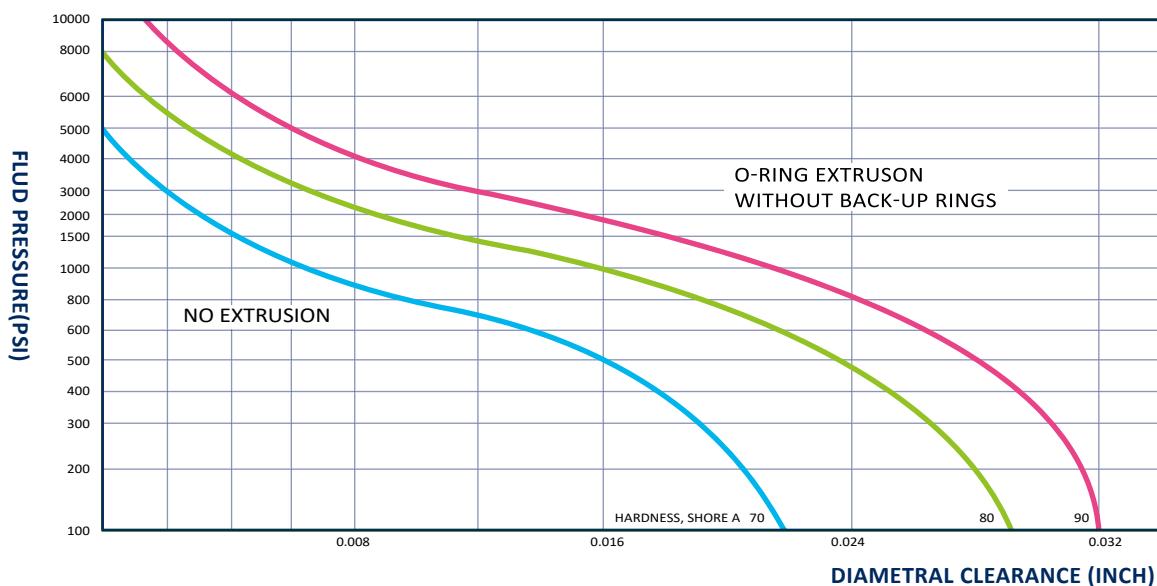

FIG. 2 : EXTRUSION LIMIT OF O-RING

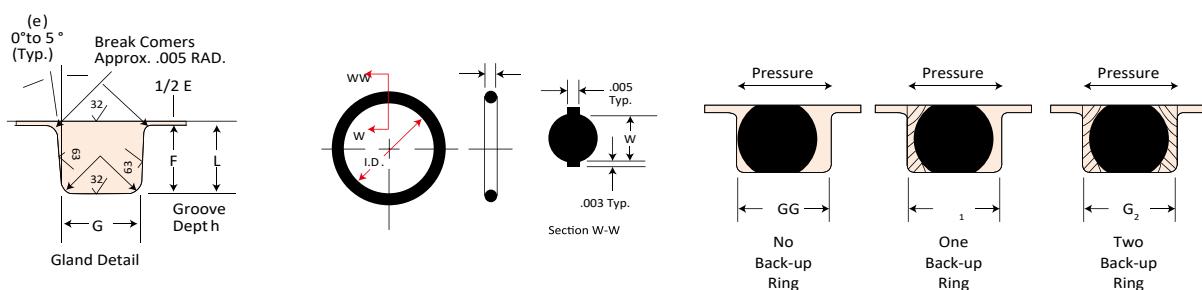

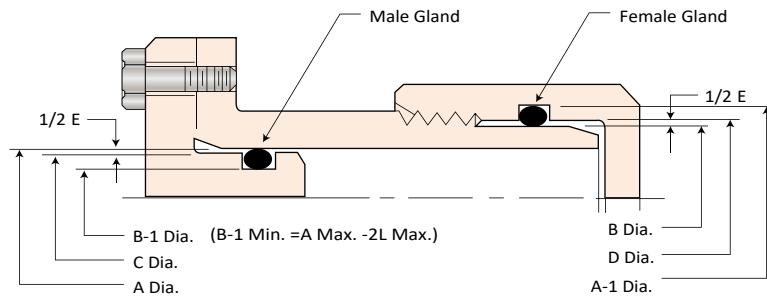

General Properties of Elastomers

Table 1: Limit of the Diametral Clearance (Unit: Inch) Against Fluid Pressure

Extrusion happens beyond the limit of diametral clearance against fluid pressure.

(a) Clearance (extrusion gap) must be held to a minimum consistent with design requirements for temperature range variation.

(b) Total indicator reading between groove and adjacent bearing surface.

(c) Reduce maximum diametral clearance 50% when using silicone or fluorosilicone O-Rings.

(d) For ease of assembly, when Back-up Ring are used, gland depth may be increased up to 5%.

X-RING

6 X-Ring

6. X-Ring

Next-Level Sealing with Superior Stability

X-Rings, with their innovative four-lobed design, provide advanced sealing performance, surpassing standard O-Rings in both static and dynamic applications.

Key benefits include:

- Enhanced leakage control with double the sealing contact area compared to traditional O-Rings.
- Reduced squeeze and friction, promoting improved efficiency and longevity.
- Strategically positioned parting lines away from critical sealing areas, ensuring consistent reliability.

In rotary dynamic applications, X-Rings resist twisting and rolling, enabling the design of narrower grooves while maintaining compatibility with standard O-Ring grooves. Matching the dimensions of O-Rings (cross-section and inner diameter), our X-Rings are available in AS568 and metric standard sizes.

Robust Support to Prevent O-Ring Extrusion

Back-up Rings provide crucial anti-extrusion support for O-Rings in high-pressure sealing applications.

Specifically engineered for demanding environments, Back-up Rings:

- Prevent extrusion of O-Ring material into clearance gaps caused by high internal pressure.
- Extend the lifespan of O-Rings, ensuring long-term reliability in applications with large extrusion gaps or elevated temperatures.

While options like reducing clearance gaps or increasing O-Ring durometer can mitigate extrusion, Back-up Rings remain the most cost-effective and practical solution. Made from high-durometer materials, including Nitrile, Viton® (FKM), and PTFE, these rings act as a durable barrier against extrusion failure. For bidirectional pressure environments, use two Back-up Rings per O-Ring for optimal protection.

8 V-Seal

8. V-Seal

The V-Seal is a versatile all-rubber seal that mounts directly onto the shaft and provides axial sealing against a counter face, housing, seal case, or similar surface. Its long, flexible lip is specifically designed to function like a mechanical face seal, effectively retaining lubricants and excluding contaminants. The V-Seal can serve as either a primary seal or a secondary backup seal.

It performs exceptionally well in dry applications and offers superior capability to accommodate greater levels of eccentricity and misalignment compared to most radial lip-type seals.

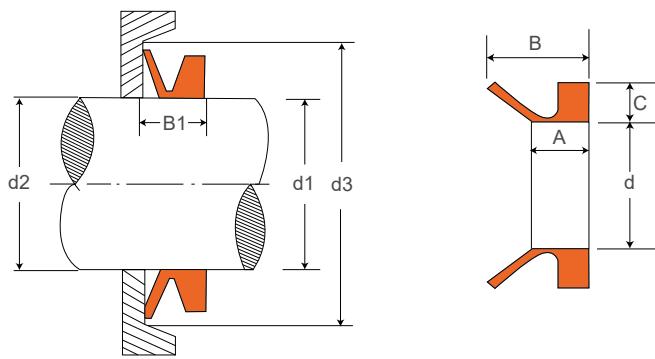

DSC offers V-seals in compliance with various standards, available in both millimeter and inch dimensions.

Reliable Sealing and Versatile Protection

Washers are essential flat seals designed to be placed under fasteners for effective and secure sealing.

These multipurpose components are ideal for:

- Preventing fluid and gas leaks, ensuring reliable containment.
- Reducing vibration and noise, enhancing stability in applications.
- Distributing pressure, protecting mating surfaces against wear.

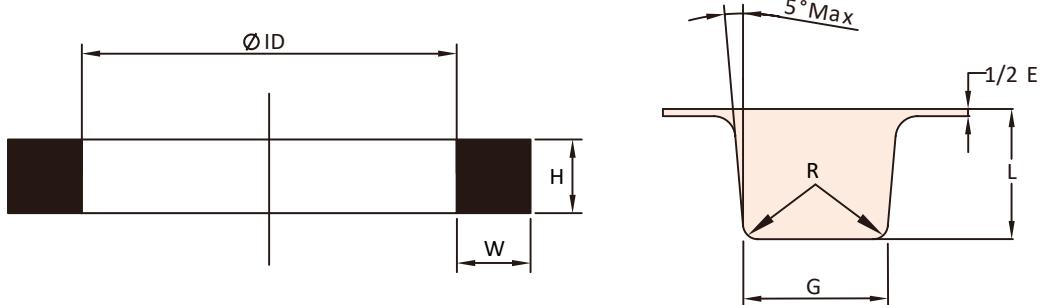

Their flexible construction guarantees a tight seal while offering resistance to compression, abrasion, and challenging environmental conditions such as moisture and temperature fluctuations. Crafted from high-quality rubber materials—Nitrile, EPDM, Neoprene, and silicone—our washers can be tailored to resist specific chemicals and environmental factors. With a wide range of sizes and shapes available, you can easily find the perfect washer for your sealing or cushioning needs.
